Over the past 20 years, catchment management authorities (CMAs) and government have worked with landholders to manage riparian land. Typical management activities have included fencing, revegetation, provision of off-stream stock watering infrastructure and weed and pest animal management.

Riparian land with native vegetation in good condition is important for waterway health. It provides habitat for plants and animals, improves water quality, stabilises stream banks, supplies food for fish and other in-stream organisms and provides a corridor for the movement of native plants and animals.

This fact sheet presents the direct benefits to beef cattle farmers from managing riparian land.

What is riparian land?
Land that adjoins rivers, creeks, estuaries, lakes and wetlands is known as riparian land (often called ‘frontage’). Riparian land is often the only remaining area of remnant vegetation in the landscape.

What are the benefits of riparian works to beef cattle farmers?
On a personal and property scale, managing riparian land has a number of direct benefits to beef cattle farmers that are supported by sound evidence:

• production benefits e.g. reduced time mustering cattle, increased weight gain, reduced risks to animal health
• improved property prices e.g. adding market value from native vegetation
• landholder wellbeing e.g. personal pride and a ‘feel good factor’.

Production benefits

Reduced time mustering cattle

A number of independent Australian studies have shown that fencing riparian land can increase the ease of mustering cattle, which in turn can reduce farm costs.

A Victorian study of Crown frontage licence holders revealed that 50% of survey respondents considered fencing their waterway to be an important to very important productivity benefit in managing livestock1.

Increased production

When a waterway is fenced off, direct stock access to water is often lost. However, a number of off-stream stock watering options are typically employed that provide a safer, cleaner and more reliable source of drinking water.

For example, troughs provide easy stock access to water that is less likely to contain pathogens than water consumed directly from waterways. Greater access to higher quality water means that livestock will drink more of it and the more water cattle consume, the more they eat and hence the more weight they put on.

For example, a North American study showed that elevated total dissolved solids in water adversely affected the palatability of water hence consumption and indirectly feed consumption and performance2.

Reduced risks to animal health

Off-stream stock watering may also reduce the incidence of disease in cattle. Interviews with cattle producers in the USA noted that “Many producers commented on general herd health improvements that resulted from implementing their stream exclusion systems. Most producers who provided an alternative source of water for their livestock saw a decrease in incidence of disease. Common diseases that declined after stream exclusion included foot rot, pink eye, scours and mastitis3.”

Shelter belts
The evidence of the benefits of shelter belts to stock wellbeing and production is well documented.

A report prepared for the Basalt to Bay Landcare Network in south west Victoria provides summaries of numerous studies demonstrating many different ways in which shelter belts provide landholders with economic benefit. For example, protected areas of farms can have a 20 to 30% higher yield than unprotected areas.

Improved property prices
Evidence from several Australian studies based on farm sales suggests that well managed riparian frontages can improve the market value of a rural property.

In one report, evidence from real estate agents suggests that well managed riparian frontages can add up to 10% of the market value of a rural property.

In Victoria, a number of recent studies have found that:
- there is an optimal proportion of native vegetation influencing positive property values - about 40%
- private benefits of native vegetation are greater per unit area on small and medium-sized farms (both commercial and lifestyle) and lesser on large production-oriented farms (leading to property value increases from 5 to 16% with the optimum amount of native vegetation)
- location characteristics are important determinants of property values e.g. proximity to lakes, rivers, and parks for recreational opportunities.

Improved aesthetics and landholder wellbeing
Many landholders are motivated to carry out riparian works for aesthetic and environmental reasons, including the peace and beauty of having native vegetation and wildlife on the farm with some recreational benefits, such as fishing, boating and relaxing.

A Victorian riparian works evaluation report included survey results which showed that improving the aesthetic value of the riparian land was one of the top three responses given by landholders in response to why they undertook riparian works. Other top reasons were to improve the health of the waterway and to improve overall environmental outcomes across the property.

This finding is supported by a more recent Victorian survey of landholders with Crown water frontage licences which found that the most important benefits from managing riparian land were non-commercial e.g. creation of habitat for native birds, attractive and aesthetic frontages.

Managing riparian land: benefits to beef cattle farmers

These studies also showed that regardless of a landholder’s initial motivation for managing riparian land, a key outcome is often a more aesthetically pleasing farm which is highly valued by the landholder.

Further evidence can be found from the USA, where a study of 268 farmers of the mid-western watershed of Michigan, revealed that landholders were more likely to manage riparian land based on their attachment to land and their desire to conserve land for future generations rather than a motivator of receiving economic compensation.

Want to manage your riparian land?

More information about riparian management programs in your region can be obtained from your CMA.

Further information

Fact sheet series

This is one in a series of fact sheets on the benefits for landholders in managing riparian land. Other fact sheets include a summary as well as fact sheets covering specific benefits to:

• dairy farmers
• sheep graziers
• croppers.

The fact sheet series has been developed from a longer report investigating the benefits to landholders of undertaking riparian work. The fact sheets and full report can be found in the riparian land section on the DELWP website.
